Plain vs HTML content of a field

Problem: I need to be able to control whether to output plain or HTML version of Jira field?

Solution: Refer to the table below to find the right syntax that allows to you reference plain or HTML content of particular Jira field

Jira field	Plain	HTML
comment	$issue.fields.comment.comments.body	$issue.renderedFields.comment.comments.body
description	$issue.fields.description	$issue.renderedFields.description
$issue.lastcomment	$issue.lastcomment.plain_body	$issue.lastcomment.body

For any other field, the rule of thumb is that $issue.renderedFields will contain the HTML version of field value and $issue.fields - plain-text value of field.
