

Customisation of message depending on user locale

Problem: I need to notify people in the language that they prefer.

Solution: You can get user's preferred language using statement `$context.userLanguage`. The value returned is a 3 letter [ISO 639-2/T](#) code that represents user's language

Follows the example on how to use it in template:

```
#if ($context.userLanguage == "eng")
    Message in English
#elseif ($context.userLanguage == "ger")
    Nachricht auf Deutsch
#elseif ($context.userLanguage == "spa")
    Mensaje en español
#else
    Message in English
#end
```

Note, that in lines 7-8 we default to English message in case user language was not resolved to a known one.
